

Military, Intelligence, Law Enforcement Officers Predict an American Civil War

By NWV Senior Political News Writer, Jim Kouri

In a news analysis video, intelligence analyst and Iraq/Afghanistan war veteran Samuel Culper breaks down what's likely in store for America and what can be expected. It's one more view of the internal strife predicted by experts in military conflict, intelligence gathering and analysis and law enforcement's role in urban warfare.

We have to differentiate "civil war" which is an armed conflict between ORGANIZED groups over control over a government, and "low intensity conflict" which is a war among people or the state. A civil war with organized groups, i.e. armies, is unlikely. A "low intensity conflict" is already happening. [The new civil war](#) will probably entail an armed conflict between those adhering to a leftist ideology whose long-term goal is achieving a One World Government that seeks to divide the earth's resources and riches more fairly.

We're talking about violence primarily among the People – left/right, urban, rural, etc. – not a war over control for Washington D.C. a/k/a The Swamp.

Samuel Culper is a former military intelligence NCO (non-commissioned officer) and civilian intelligence analyst. He spent three years in Iraq and Afghanistan as a soldier and intelligence contractor, and now runs the intelligence shop at Forward Observer. His staff includes **Daniel Johnson** is a former U.S. Marine infantry scout/sniper section leader, and

company close quarters battle and enhanced marksmanship program instructor. After being discharged from the Marine Corps, Daniel went to work for the State Department's Worldwide Protective Services program where he served on a principal recovery and extraction team, as well as an advance and tactical site survey team. After sustaining a serious injury from an enemy attack in Baghdad, he was forced to return home. He's now learning the ropes of multi-discipline intelligence collection and all-source analysis.

Here's what knowledgeable commentators from multiple sources – many of whom have operated inside collapsing, war-torn cities and countries – predicted when interviewed by Professor of Criminology Mike Adams, an American conservative political columnist, writer, author and faculty member at University of North Carolina Wilmington.

- There won't be a nationwide kinetic civil war fought like America's first Civil War. Instead, outbreaks of kinetic violence will be very limited to the areas in and around high-density population centers dominated by Leftists (i.e. Antifa and similar left-wing lunatics).
- This means **your proximity to left-wing cities** largely determines your risk of being caught up in any kind of kinetic engagement. The closer you are to the "zombies,"

the worse off you'll be when it hits the fan.

- At the same time, if you live in rural America, far from left-wing strongholds, **your risk of being involved in kinetic engagement is virtually zero**, according to my sources. They do not expect any mass exodus from liberal cities, since it is well understood that liberal zombies are incapable of doing anything that requires effort (such as walking a distance, or reading a topo map, etc.).

- Evacuating those cities will be largely impossible. Law enforcement isn't even planning to try to run such evacuations for the largest cities like Los Angeles. The strategy is to keep people in place and attempt to support them with deliveries of food, water and medical supplies, should circumstances require. In effect, the response strategy will be to *quarantine* cities that are collapsing, and not risk National Guard troops trying to enter those cities once they've passed a certain point of lawlessness. (I was specifically told that the first responders already realize that trying to stop crime is just playing a game of "whack-a-mole" once the crime rate passes a certain point.)
- Ironically, the closer you live to left-wing stronghold cities, the more likely the government has restricted your ability to own firearms and normal-capacity magazines. Thus, the very people who will need firearms

the most are being stripped of their Second Amendment rights in advance of the coming chaos. (Hint: Move to somewhere else.)

- When it comes to safety buffer zones from liberal cities, there are three distances that matter. First is the *walking* distance from your nearest liberal city. In other words, how long would it take the zombies to reach you if they are on foot? 25-50 miles away is generally considered to be sufficiently far away from the majority of walkers, although such distances are considered quite small for military veterans. The second distance to consider is the *driving* distance, which means how far someone might get on one tank of gas. This is roughly considered to be about 400 miles, although in a collapse scenario, even the zombies won't have much success driving anywhere since the roads will likely be either jammed up or rigged as ambush points. The distance of 400 miles means there is practically no place along the East Coast that is a safe distance away from a liberal city. You have to head West – into Texas, Oklahoma, Colorado, Utah, Arizona, Idaho, Wyoming, etc. – to get away from the cities. Along the Left Coast, you of course have to head inland, getting yourself situated in Eastern California, Eastern Oregon or Eastern Washington rather than risking proximity to collapsing cities like Los Angeles, Portland or Seattle.

- By the way, as a relevant side note, when it comes to cross-country

fleeing via vehicles, stupid zombie liberals will drive their cars at night with their headlights on and tail lights functioning. Experienced veterans will pull the fuses for all their lights and drive using night vision, which is very dangerous but not as dangerous as running with your headlights at night, right into an ambush.

- If you live far from the liberal “zombie” cities, your biggest issue will be **collapsing infrastructures** such as grocery deliveries, fuel deliveries, communications infrastructure, medical supplies and possibly regional power grid failures. Thus, the strategy for those who are not in close proximity to liberal cities is to **stockpile supplies** and prepare to ride out a period of chaos and disruptions. During this chaos, there will of course be local looting and crimes of desperation, but there will not be organized left-wing waves of communist lunatics trying to sweep across the geography.
- This means the survival strategies are very different depending on your proximity to left-wing cities. To summarize, if you’re close to a city, you may be swept up in kinetic engagement initiated by the lunatic Leftists. If you’re in rural areas, your most likely challenge will be surviving disruptions of logistics, deliveries and essential services.
- The biggest gap in the preparedness efforts of most people today is a **lack of communications capabilities**. Even many preppers don’t have radio skills to monitor frequencies, use repeaters or coordinate community defense or rescue operations when needed. Most people have no idea what frequencies are used by local police and emergency services, and they don’t even have practical radios to communicate with neighbors or family members who may be on patrol around their own property. Even the simple MURS or GMRS radios can be incredibly useful, but acquiring and learning to use radios that can listen to a far large spectrum of frequencies is strongly recommended.

- One website that's been recommended to me is [com](#), which will soon be indexed by [Censored.news](#) as well. Forward Observer is written by individuals with impressive real-world skills in intelligence gathering and action responses to incoming intel. The mission statement of this website is, "Deliver high impact intelligence to shape a real-world, ground level understanding of America's likely tumultuous future." The site is largely written by U.S. Special Operations and Intelligence personnel, which explains how I came to know about this work (I know the people who know those people, in other words). As you'll learn on this site, it's also highly recommended that you acquire detailed topo maps for your local area so that you can navigate streams, roads, railroad tracks, etc., when needed.
- All the standard preps such as food, emergency medicine, water filters, ammo, etc., are obviously needed no matter what happens. But beyond the bullets and band-aids, you need intelligence, communications and ground-level familiarity with your geographic reality if you hope to shore up your community defenses and resilience. We've got a decent selection of some preparedness gear at [com](#), including our ever-popular [Ranger Buckets which are certified organic, lab-tested storable food pails](#) that come with bonus survival gear items. We can barely keep these in stock, but we've recently added more personnel to our operations, so we hope to have more inventory over the next few months. If those are out of stock, we offer an alternative, which is sealed #10 cans packed with a variety of lab-verified freeze-dried fruits, vegetables, miso soup powders, spirulina and more. [See the full selection here](#).
- The goal of rural communities that don't have to deal with left-wing zombie waves will be to **maintain the rule of law**, re-establish barter and trade in a safe environment, and keep the roadways safe and usable so that citizens can engage in trade. From this,

communities can survive and even thrive.

- As recent attacks in Saudi Arabia revealed, key infrastructure in America are now highly vulnerable to drone attacks. In the United States, this includes power grid substations, oil refineries, communications towers and water delivery facilities. Drones enable an ease of attack that has previously never existed. For example, how hard would it be for domestic terrorists to fly a drone filled with some sort of high potency poison right into the water canals that feed a city like Phoenix or Los Angeles? There are essentially zero defenses against such acts, and similar vulnerabilities exist for power grid substations and power generation stations that feed the power consumption of large cities. Without power, large cities very quickly collapse into chaos.
- If you do not yet own some sort of night vision device such as a PVS-14 (or something better), you are already behind the curve and are hopelessly out-gearred from an equipment point of view. Such devices allow you to see the IR designation beams or IR illuminators of organized attackers. They also allow you to see and maneuver in low-light or nearly no-light conditions, especially if you have your own IR illumination device. [com](#) sells numerous night vision devices and is run by very knowledgeable people.
