

TB OR NOT TB? More Than A Mere Question

By Sidney Secular

July 10, 2024

Those with a narrow focus fixate on terrorism threats coming from un-vetted refugees. But there are greater security and safety risks with the myriad diseases gaining entry into the US via the vectors of the refugee invaders and so-called “unaccompanied (alien) children.” Tuberculosis (TB), one of these diseases – and potentially the one to be feared most – is an airborne infectious disease spread as is the common cold by coughing and sneezing. There are about 13 million people in the US that have been exposed to TB and especially the “at risk*” population could develop the disease. (*At risk people are the very young, the very old, those who are already weakened by various health conditions or are addicted to substances that affect their general health.)

There are PR campaigns in Africa advising people to cover their mouths when coughing and spitting in a crowded area while various societies work to increase ventilation in crowded places, etc.– but how about America? There was such a campaign along with the huge lockdowns and attacks on personal liberties brought about by the COVID scam, but as a result Americans are wary of claims of “medical emergencies” that might, with regard to TB, be far more real than any Wuhan-based pathogen! On the other hand, though “health experts” and “politicians” round the world just thrill to the possibility of playing tyrant again, our “fearless leaders” tend to shy

away from warning the general public of the dangers of this refugee invasion! For after 20 years of decline, US TB rates are moving upwards and this fact can only be traced to the massive migrant movement from TB hotspots around the world into the US. Proof can be found in the fact that our migrant mobbed states—CA, NY, TX, and FL have half the nation's TB cases.

The Center For Disease Control (CDC) is allowing migrants into the US without screening or treatment for latent TB. There are many more people with latent TB—one-third of the world's people!—than actually show symptoms of the disease—and the latent cases could turn active at any time. The Bible's Book of Revelation prophesizes that one third the world's population will die of "plagues" during the "end-times!" It is not importune to ask if these latent TB cases and other dangerous diseases unknowingly carried by the invaders be what is being described? Certainly, there is no manifest proof otherwise!

Treating TB is no treat. Rather, it is expensive, labor intensive and difficult to consummate requiring patients with active TB to take drugs daily, sometimes several times per day, over a 6 month period. The doses must be administered by a health care worker, and not a family member. The said worker must actually watch the patient swallow every dose and in the case of people with mental problems or addicts, there is no guarantee of his or her cooperation. If the patient can't come to a clinic, the health care worker must come to the patient's abode. Treating active TB in routine cases averages \$17,000 for full treatment, but can run up to \$430,000 when patients are resistant to drugs or to the treatment itself. When the problem is the drugs, then different or multiple drugs must be administered. Moreover, about 5% of those supposedly successfully treated will have a recurrence of the disease. TB doesn't attract media attention as do over-hyped infectious diseases such as Zika and Ebola get. Only half the funds

authorized to develop a vaccine and better drugs to treat TB are actually allocated, showing how lackadaisically the threat is being treated.

Besides TB, the invaders are also bringing with them yellow fever – spread like malaria by the mosquito, a creature the US has in plenty, measles, whooping cough, diphtheria and other diseases that were on the fast road to eradication in the US a short time ago. Playing politics with public health issues might be a potent killer of American citizens but it may have them having to resurrect COVID.
