

The Invisible Rainbow

By Sidney Secular

February 27, 2025

OMNIPRESENT MIASMATIC ELECTRO-MAGNETIC FIELDS: It's basic science that when electrons (as electricity) move through wires, a magnetic field is created in the space around the wires. We know that our bodies contain their own natural magnetic fields and even auras, and that the said artificial magnetic fields (EMFs) interfere with the functioning of our bodies and its fields. Studies show that a higher incidence of various diseases occur when the outside magnetic fields are both strong enough and close enough to the body to create such influences.

The introduction of electricity in the 1800s revolutionized human societies, allowing for the development of sophisticated technologies, and equipment and instruments that utilized these technologies. The first of these was the telegraph – that is, the technology and systems introduced around 1839, and by 1850 had resulted in 22,000 miles of telegraph lines installed in the US alone. By 1875, 30,000 miles of undersea cables had been laid under the oceans while 700,000 miles of copper wire had been installed over the surface of the earth, enough wire to encircle the earth almost 30 times. Only about 20 years later, the electric motor made the telegraph look like a child's toy while the electric locomotive provided transportation across every city and countryside. Then, suddenly, doctors around the world became overwhelmed by floods of people ill with a disease that many hadn't seen before – influenza. In his eye-opening book, "The

Invisible Rainbow," Arthur Firstenberg graphically shows the correlation between influenza and the rise of "man-made" electricity in the environment.

In 1918, the era of radio wave broadcasting began. Hundreds of powerful radio antennas were erected emitting radio waves at the LF and VLF frequencies, that soon became omnipresent in the earth's magnetic field, something that you realize when you turn on your radio. The beginning of this era coincided with the Spanish Flu pandemic but no connection between the two was ever noted since it was easy to blame living pathogens ("bugs") that had become the paradigm in the rhetoric of disease causation at the time – something it still basically is. This somewhat avoids taking responsibility for one's health in the adoption of a better diet, more exercise and rest and other healthful habits. In 1957, the radar era began with the building of powerful early warning radar stations in the northerly latitudes, a matter that coincided with the Asian flu epidemic of 1957. In 1968, the satellite era began, coinciding with Hong Kong flu epidemic of 1968. Over the course of many years, it has been demonstrated that people living beneath or near high power microwave and electrical transmission lines have higher rates of disease, especially cancer, than the population at large. With the introduction of the 5G towers, which emit electro-magnetic radiation at higher orders of magnitude than the previous systems, nearly everywhere now, a similar increase in the incidence of disease has been noted, with consumer groups instituting lawsuits to stop the spread of the towers.

Nearly constant exposure to cellphones, even if only in purses and not in pockets located on the body proper, has been linked to increases in levels of disease. Social media apps are being linked to increased levels of anxiety and depression, especially among teenagers. Now, in the last several years, the previously unknown disorder of tinnitus is being loudly trumpeted. It is characterized by hisses and hums in our heads

which are beyond the usual noises that are a part of modern life. The author blames the electro-magnetic fields, which have sort of hit a critical mass for this phenomenon to arise. The aforesaid book makes the connection between many of our maladies and the ever-intensifying presence of electromagnetic fields in our environment. Since the greens are pushing to have electrical appliances and motor vehicles replace the ones that have operated via fossil fuels up to now, we can expect a further spike in the maladies associated with the “invisible rainbow”.
