

Vaccines: Good Or Bad?, Part 5

Please keep in mind that this series will only scratch the surface of the subject of vaccines. I hope to give enough information so that you will want to become involved in what government is attempting to do with the lives of Americans, your lives and the lives of your family.

There are many things about vaccines that most people don't even consider. They believe, like I used to do, that the government wouldn't do anything that wasn't beneficial to the American people. That could not be farther from the truth! One has to think about the effects of putting multiple groups of chemicals into a body and what affect that has on the body. When looking at fluoride in our water it is a very miniscule amount but doing that multiple times a day for years and years cannot be good. *One of the two carcinogenicity studies was conducted by the National Toxicology Program (NTP). This peer-reviewed study provided sodium fluoride in drinking water to rats and mice and determined the occurrence of tumor formation in many different organ systems. The peer review panel concluded that, "Under the conditions of these 2-year dosed water studies, there was equivocal evidence of carcinogenic activity of sodium fluoride in male F344/N rats, based on the occurrence of a small number of osteosarcomas in dosed animals. There was no evidence of carcinogenic activity in female F344/N rats receiving sodium fluoride at concentrations of 25, 100, or 175 ppm (0, 11, 45, 79 ppm fluoride) in drinking water for 2 years. There was no evidence of carcinogenic activity of sodium fluoride in male or female mice receiving sodium fluoride at concentrations of 25, 100, or 175 ppm in drinking water for 2 years."* The Ad Hoc Subcommittee on Fluoride concurs with this conclusion.

The other carcinogenicity study was sponsored by the Procter

and Gamble Company using Cr:CD (Sprague-Dawley) rats and Crl:CD-1 (ICR) mice both treated with 0, 4, 10, or 25 milligrams/kilogram/day sodium fluoride added to a low fluoride-basal diet. A second control group received powdered rodent chow. There was no evidence of malignant tumors associated with sodium fluoride in mice and rats of either sex in the Procter and Gamble study. While there were two osteosarcomas in the low dose female rats, one osteosarcoma in a high dose male rat, and one fibroblastic sarcoma in a mid-dose male rat, these findings in treated animals were not statistically different from controls. Male and female mice in the study did have a statistically significant increase in benign bone tumors (osteomas). The significance of a Type C retrovirus, detected in the osteomas, remains to be determined. Osteomas and osteosarcomas are different in anatomical site and clinical course. The FDA also noted difficulty in assessing the dose-related aspects of the osteomas in mice (see page 75-6). Furthermore, osteomas and osteosarcomas are so rare normally in rodents that the relationship between these tumors cannot be accurately stated.

When the NTP and the Procter and Gamble studies are combined, a total of eight individual sex/species groups are available for analysis. Seven of these groups showed no significant evidence of malignant tumor formation. One of these groups, male rats from the NTP study, showed "equivocal" evidence of carcinogenicity, which is defined by NTP as a marginal increase in neoplasms—i.e., osteosarcomas—that may be chemically related. Taken together, the two animal studies available at this time fail to establish an association between fluoride and cancer.

There have been over 50 human epidemiology studies of the relationship between water fluoridation and cancer. Epidemiological studies of fluoride usually attempt to identify statistical associations between cancer rates and county- or city-wide patterns of water fluoridation. Expert

panels which reviewed this international body of literature agree that there is no credible evidence of an association between either natural fluoride or adjusted fluoride in drinking water and human cancer (LARC, 1982; Knox, 1985). Interpretation of these studies is limited by the inability to measure individual fluoride exposures or to measure other individual predictors of cancer risk, such as smoking or occupational exposures.[1]

One of the major concerns I have is the fact of mandatory vaccines for both children and adults. I believe that this is a violation of our freedoms. Just this year there was a breakout of small pox. The first child that got it was a student who had been vaccinated for it! *Close to one-quarter of students at a California elementary school have been directed by school officials to stay home for three weeks due to a small onset of chickenpox cases that began in March.*

The chickenpox outbreak at Mariposa School of Global Education in Augora Hills, California is unique because the first case of chickenpox discovered at the school was found in a student who had been fully vaccinated.

Daniel Stepenosky, the superintendent of Las Virgenes Unified School District that includes the Mariposa School, [acknowledged](#) to CBS Los Angeles that three students were found to have chickenpox. "A kindergartener, a first-grader, a third-grader. The first case happened around mid-March. The student was immunized, however still contracted chickenpox."

According to local newspaper, The Acorn, Stepenosky [noted](#) that "(It's) interesting . . . the first of three cases was a student that was fully immunized. . . . He was the vaccinated one."

This student was reported to have contracted the disease back in March. After two more cases were found, the school district took action to keep the unvaccinated students out of school

for three weeks.

While individual school policies vary according to state laws, it's typical for school officials to notify parents who do not vaccinate their children when an outbreak of a vaccine-preventable disease occurs. About 400 students attend Mariposa School of Global Education. Around ninety of those students have not been vaccinated for chickenpox, and on May 1st the parents of those students were ordered to keep their children home for 21 days.

"Given that there were three cases, given that they were in three different grades, the health department gave the directive to exclude students who are not immunized," said Stepenosky.

Vaccination rates at the Mariposa School have risen greatly in recent years. In 2015, it was reported that about 40% of the students were current on vaccinations; following changes in state law, that number is up to 80%.[2]

*As I state earlier there is greed within the pharmaceutical industry that is frightening. The health and well being of people is not their goal. Maintaining the \$200 + billion a year in multiple areas, vaccines, diabetes, cancer and others is their goal. Corruption is rife. **Thorsen is a major player and an essential character in this real-life drama.** In 2011, he was charged with 13 counts of wire fraud and nine counts of money laundering. A federal grand jury alleged Thorsen stole over \$1 million from autism research funding between February 2004 and June 2008.*

He stole the money while serving as the principal investigator for a program studying the relationship between autism and exposure to vaccines. At the time, The Copenhagen Post reported that:[¹]

"... [Thorsen] submitted over a dozen false invoices from the

CDC for research expenses to Aarhus University ... instructing them to transfer the funds to a CDC account, which was in fact his personal account ...

Thorsen's research on autism is widely known in academic circles, where he was until this week a highly respected figure. A paper of his on the subject, which is known as 'The Danish Study,' is quoted extensively to refute the autism vaccine connection."

As of 2014, Thorsen was permanently expelled from Denmark's university hospital system. Thorsen has been a fugitive for the past five years. Yet his whereabouts are no secret. As noted by Robert F. Kennedy, Jr. in a 2015 Forbes article:[^{2]}

"The fact that he is roaming free and is easy to find, despite the U.S. Federal indictment ... suggests a lack of enthusiasm by HHS and CDC to press for his capture and extradition.

The agency undoubtedly fears that a public trial would expose the pervasive corruption throughout CDC's vaccine division and the fragility of the science supporting CDC's claims about thimerosal safety." [3]

Government is not our friend. George Washington called it a necessary evil. We are seeing the evil side concerning this subject. They won't protect us so we have to protect ourselves.
