

What Our Politicians Have Done To America, Part 18

Looking at the final goal of the UN in Agenda 2030 we see the final nail in the coffin for personal liberties, personal freedoms, and the ability to make a better life for you and your family; **Goal 17) Strengthen the means of implementation and revitalize the global partnership for sustainable development.**[1] This goal will only favor global corporations that submit to the NWO agenda. They will be the ones who will get the trade deals, manufacturing deals, farm deals and so on. Small businesses will no longer exist because they only benefit individuals not the community as a whole, at least that is what they will say. They will be outlawed or taxed out of existence. Government will control monopolies on food, seeds, technology and even our medicine.

National laws will be ignored in favor of global benefits for corporations that are puppets for the UN. This will not be done in a democratic manner. It will be forced upon the people through government coercion. They want equality for all at the expense of everybody. There never has been total equality and never will be, naturally. Only through forced wealth redistribution can this happen. ***The key here? Global warming is nowhere in sight.***

But instead of rolling with the fact global warming is not living up to the hype, scientists are manipulating weather records so that it looks like the planet is still warming.

The reason is because climate change – also known as global warming – has to be kept alive since it is the long-term tool governments are using to redistribute wealth. If global warming isn't real, then all of the plans hinging on people buying into climate change panic will have to be redone ... which is exactly what we're seeing.

During President Obama's [State of the Union address](#) in January, he claimed, "Climate change poses immediate risks to our national security ... that's why, over the past six years, we've done more than ever before to combat climate change."

Sen. Jim Inhofe of Oklahoma [released a prompt response](#) to the president's agenda, citing it would cost Americans \$479 billion, with the effect of reducing CO2 emissions by half a percent ... global temperatures by two one-hundredths ... and sea levels by one one-hundredth of an inch.

Do not be mistaken. As [The Wall Street Journal](#) has reported, this is a wealth redistribution scheme. [2]

All the facts about climate change are fake. The theory that it is man-made is an outright lie and will be used for wealth redistribution.. They claim that the majority of the animals that used to occupy Australia were wiped out by climate change over the last half million years. Think about that. Man has never had the capability to 'change the climate' until recently but then only if nuclear bombs are dropped all over the world. Besides, man hasn't been here that long. Go figure. *"For about the last half-million years it's been consistently getting drier in Australia," Dr Gregory Webb told Reuters after studying fossil-rich areas of south-east Queensland state.*

"The apparent progressive megafaunal extinction on the Darling Downs does not support the sudden blitzkrieg model resulting from human hunting," Webb's report said.

The megafauna – kangaroos 2.5 metres (8 feet) tall, wombats as big as cars and cattle, giant Ostrich-like Emus and lizards – were common in vast areas of Australia 40,000 years ago before gradually disappearing.

Most theories on their vanishing centre on the arrival in Australia around the same time of Aboriginal people, who were believed to have hunted the animals out of existence.

But Webb, from Queensland University of Technology, said a study done with colleague Dr Gilbert Price had found many animals were probably drought-stressed when they died.

If humans had been responsible, he said, the fossil evidence would show the vulnerable and easily-hunted animals dying out around the same period rather than over thousands of years.

“Whole habitats changed, from forests which required a lot of rainfall to grasslands, and now it has become much more open and scrubbier,” Webb said.

“Of course the organisms that required more enclosed lush, green habitat simply had nowhere to live.”

Scientists have said that Australia must brace itself for long-term climate change and water shortages due to the accelerating pace of global warming.[3]

Keep in mind that they believe that man has caused this. But studies show that the Earth was warmer in Medieval times than it is today! Think about that. Before 100% of internal combustion engines, factories, planes, 80% of the Earth's population and all the animals it takes to feed us today, we are cooler today than in the 1400's. *If you think the Earth is hot now, try wearing plate armor in the Middle Ages.*

A Swedish [study](#) found that the planet was warmer in ancient Roman times and the Middle Ages than today, challenging the mainstream idea that man-made greenhouse gas emissions are the main drivers of global warming.

The [study](#), by scientist Leif Kullman, analyzed 455 “radiocarbon-dated mega-fossils” in the Scandes mountains and found that tree lines for different species of trees were higher during the Roman and Medieval times than they are today. Not only that, but the temperatures were higher as well.

“Historical tree line positions are viewed in relation to early 21st century equivalents, and indicate that tree line elevations attained during the past century and in association with modern climate warming are highly unusual, but not unique, phenomena from the perspective of the past 4,800 years,” Kullman found. “Prior to that, the pine tree line (and summer temperatures) was consistently higher than present, as it was also during the Roman and Medieval periods.”

Kullman also wrote that “summer temperatures during the early Holocene thermal optimum may have been 2.3°C higher than present.” The “Holocene thermal optimum was a warm period that occurred between 9,000 and 5,000 years ago. This warm period was followed by a gradual cooling period.”

According to Kullman, the temperature spikes were during the Roman and Medieval warming periods “were succeeded by a distinct tree line/temperature dip, broadly corresponding to the Little Ice Age.”[4]

The real CO₂ producers are volcanoes. [Volcanoes](#) may have been overtaken in the carbon stakes, but in order to properly assess the consequences of human pollution, we need the reference point of the natural background. And we’re getting there; the last twenty years have seen huge steps in our understanding of how, and how much CO₂ leaves the deep Earth. But at the same time, a disturbing pattern has been emerging.

In 1992, it was thought that volcanic degassing released something like 100 million tons of CO₂ each year. Around the turn of the millennium, this figure was getting closer to 200. The most recent estimate, released this February, comes from a team led by Mike Burton, of the Italian National Institute of Geophysics and Volcanology – and it’s just shy of 600 million tons. It caps a staggering trend: A six-fold increase in just two decades.

These inflating figures, I hasten to add, don’t mean that our

planet is suddenly venting more CO₂.

Humanity certainly is; but any changes to the volcanic background level would occur over generations, not years. The rise we're seeing now, therefore, must have been there all along: As scientific progress is widening our perspective, the daunting outline of how little we really know about volcanoes is beginning to loom large.

If you're a topical expert – researcher, business leader, author or innovator – and would like to contribute an op-ed piece, [email us here](#).

Quiet monsters

The exhalations of our planet can be [spectacularly obvious](#). The fireworks, though, are only part of the picture. We now know that the CO₂ released during volcanic eruptions is almost insignificant compared with what happens after the camera crews get bored. The emissions that really matter are concealed. The silent, silvery plumes which are currently winding their way skyward above the 150 or so active volcanoes on our planet also carry with them the bulk of its carbon dioxide. Their coughing fits might catch the eye – but in between tantrums, the steady breathing of volcanoes quietly sheds upwards of a quarter of a billion tons of CO₂ every year.

We think. Scientists' best estimates, however, are based on an assumption. It might surprise you to learn that, well into the new century, of the 150 smokers I mentioned, almost 80 percent are still as mysterious, in terms of the quantity of CO₂ they emit, as they were a generation ago: We've only actually measured 33.[5]

The single biggest contributor to global warming is not CO₂, nor is it methane, it's water! Scientists have underestimated the role that water vapour plays in determining global

temperature changes, according to a new study that could fuel further attacks on the science of climate change.

The research, led by one of the world's top climate scientists, suggests that almost one-third of the global warming recorded during the 1990s was due to an increase in water vapour in the high atmosphere, not human emissions of greenhouse gases. A subsequent decline in water vapour after 2000 could explain a recent slowdown in global temperature rise, the scientists add.

The experts say their research does not undermine the scientific consensus that emissions of greenhouse gases from human activity drive global warming, but they call for "closer examination" of the way climate computer models consider water vapour.

The new research comes at a difficult time for climate scientists, who have been forced to defend their predictions in the face of an [embarrassing mistake in the 2007 report of the Intergovernmental Panel on Climate Change \(IPCC\)](#), which included false claims that Himalayan glaciers could melt away by 2035. There has also been heavy criticism over the way climate scientists at the University of East Anglia apparently [tried to prevent the release of data requested under Freedom of Information laws](#).

The new research, led by Susan Solomon, at the US National Oceanic and Atmospheric Administration, who co-chaired the 2007 IPCC report on the science of global warming, is published today in the journal Science, one of the most respected in the world.[6]

I bring all this up because we have to be able to recognize

when we are being hornswaggled. Man-made climate change is just that. It is a concept that will allow governments to control what you do, where you live, what you do for a living, what you eat and in other words, control everything you do. That is Agenda 2030.

The election of Trump has made these people very upset because if he gets two terms he could set them back 25-30 years, just like Reagan did in the 1980's. Be wary of the word 'sustainable' because it means less and less freedoms.

Our freedoms and the freedoms of our kids and grandkids are at stake and in our hands.
